## **Flo Healthcare Workstation Applications**

For years, mobile workstations on wheels (WOWs) from Flo Healthcare have set the standard for ergonomic design and aesthetics, as well as integration. Not only do Flo's WOWs offer true integration because they are ready to roll, fully assembled right out of the box, but they also facilitate a variety of unique applications that are unmatched by any other workstation.

**Vitals Integration:** It is easy to mount vital signs data capture and monitoring devices to Flo Healthcare's WOWs. This ability helps nurses capture real-time vitals data into the electronic medical record at the bedside, reducing medical errors and increasing patient safety.

**BCMA:** Flo Healthcare's medication workstations are designed to accommodate a variety of bar-code medication administration technologies. This process reduces human error and ensures the "five rights" of patient safety (right patient, drug, dose, route and time).

**Telemedicine:** Flo's workstations are easily customizable, enabling healthcare organizations (HCOs) to add peripherals such as video cameras and medical displays. This capability makes telemedicine a reality by facilitating videoconferencing and allowing doctors to instantaneously confer with remote experts. This technology eliminates travel for patients and clinicians and

allows them to communicate as if they were in the same room.

**Power Management:** While many vendors view batteries as a component, Flo Healthcare takes a whole systems approach to power management with its software: BatteryPro and Flo Dashboard. BatteryPro displays helpful battery data on the workstation monitor so that users can better manage the up-time of their workstations. Flo Dashboard enables IT to manage an entire fleet from a central location. These tools are highly configurable and allow users to set alerts and rules based on a variety of charge status indicators.

**Asset Management:** Flo Healthcare's workstations provide asset-tracking capabilities through partnerships with inventory management solutions providers such as InnerWireless. With these solutions, hospitals can set rules and alerts about their WOWs' locations and availability.

**Access Management:** Flo's workstations offer the ability to integrate access management devices, such as bioscanners, proximity sensors, and signature pads. These devices support proper user identification and authentication, which ensure that patient data remains secure.

**Infection Control:** Flo offers customized infection control based on a HCO's requirements. Flo can integrate sealed washable keyboards, mice, keyboard covers, and other infection-preventing barriers. Flo's integrated solutions provide cable management within the cart base, as well as a technology enclosure to protect the embedded device from liquids spillage, meaning fewer surfaces—and cords—to clean.

**Customization:** Flo Healthcare complements its family of WOWs with an extensive array of accessories that lets hospitals customize a workstation to match their exact needs. For a full list of accessories that can be configured to your specifications, contact a Flo representative.
